

The phenomenon of accelerated time

Some people are absolutely convinced that time is actually moving faster than in previous years. Others are not so sure and refer to the perception of time seeming to accelerate when you grow older. But there are some weird coincidences confirming the claim, like the subject of fingernails appearing to grow faster nowadays. A Norse myth connected to the Vikings tells of a ship made entirely of nails from the dead. The fulfillment of the ship (Naglfar) was believed to forebode 'Ragnarok,' the final battle and the end of days. Might this notion be a clue of our present times?

A neutron star approaching

Some evidence points in the direction of a twin sun closing in on our solar system. Governments all over the world firmly deny this, you might suspect an officially accepted conspiracy, an agenda being played out. I have reason to believe this twin sun (Nibiru) is actually a collapsed entity, a 'neutron star.' Basically, the actual star will be small in size but very dense and with a powerful magnetic influence. But it really is the fierce gravitational force that influences the time factor.

One could argue, however, that the potent gravitational field would slow down *every single* aspect of our solar system. Hence, the clocks would slow down, but also the movement of atomic particles and indeed our own thoughts! So, how could we tell the difference in this case? The problem lies not only in gravity affecting matter; another factor certainly plays a significant roll in this equation.

The universal evolution force

The universe, I contend, is under the influence of a spiritual development law. The Chinese books of wisdom called this law 'Tao,' translated as 'the way.' Personally, I use the term 'the universal evolution cycles.' This 'movement' is not a physical phenomenon, it is exclusively a spiritual path. In these terms, 'Tao' is not affected by physical gravity, it flows along its predetermined way. The general perception would be that time seems to be accelerating. In conclusion, time is really slowing down locally. But we notice it only because the universal evolution speed is constant.

The Tao of the universe governs the events and activities of all beings, from the tiniest particles to monumental galaxies. This spiritual 'blueprint' is not created in the moment; it has always existed. The physical universe takes shape according to this divine and powerful plan. However, increased gravity from dense stars might occasionally 'distort' the flow of time in local areas. This is indeed (from my perspective) what is right now affecting planet Earth and its present population.
